PROBLEM 2-1 (1 point possible)

Examine the following code and answer the following question without running it.

```
x = [2,1]
y = [2,1]
z = False
if x == y:
    if sorted(x) == sorted(y):
        if x.sort() == y.sort():
            z = x.sort() == sorted(y)
print z
```

The preceding Python statements will print False because

- ☐ `x` is not equal to `y`
- ☐ `sorted(x)` is not equal to `sorted(y)`
- ☐ `x.sort()` is not equal to `y.sort()`
- ☐ `x.sort()` is not equal to `sorted(y)`
